

Indian Institute of Information Technology, Nagpur

Course: Computer Networks (CSL 302, Core) 5th Semester

Topics Covered

- Layered Architecture
- OSI Model

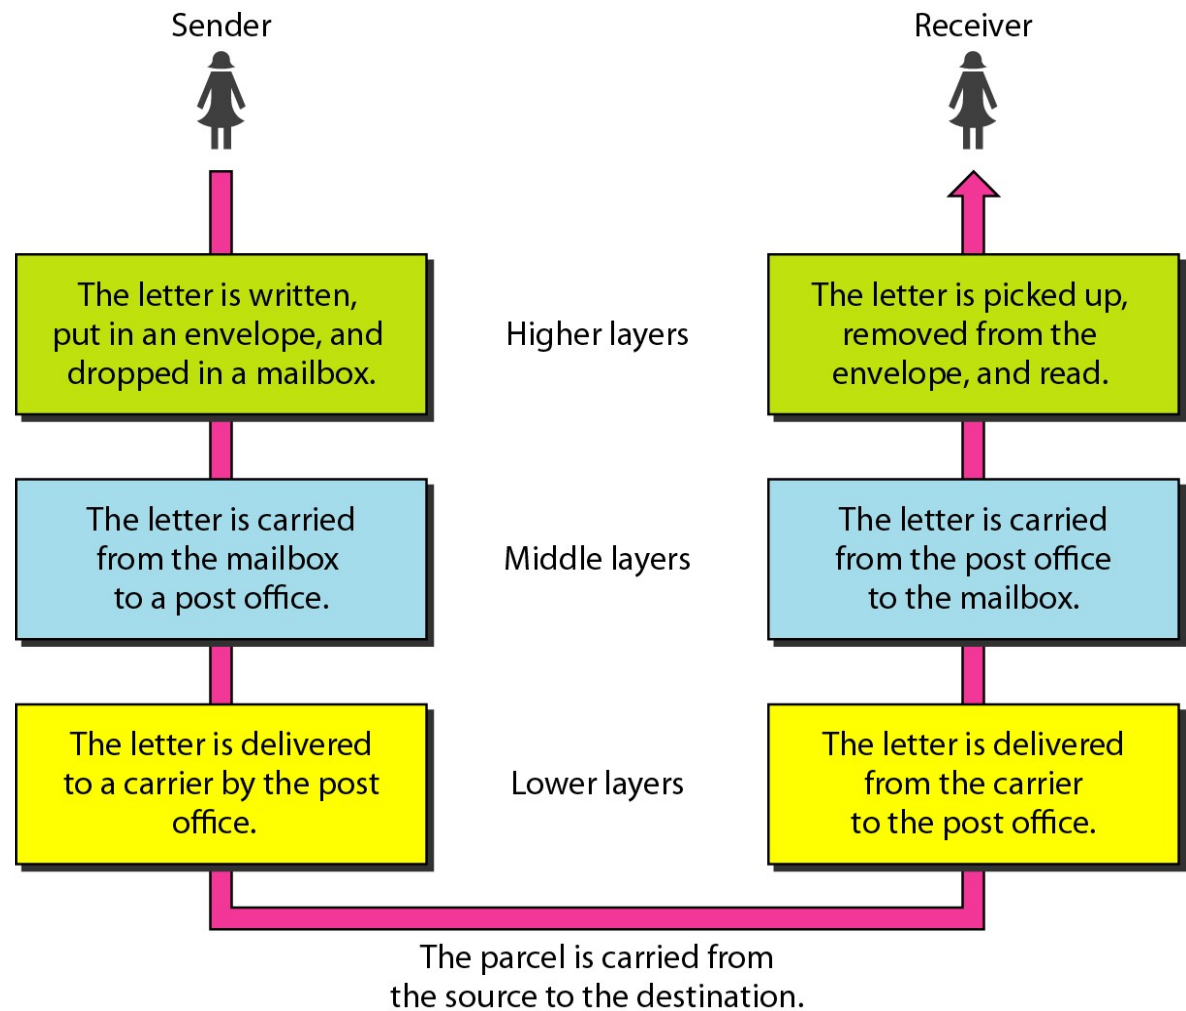

Dr. Aishwarya Ukey
Assistant Professor
Dept. of CSE, IIIT Nagpur

Introduction

- Computer network - complex piece of H/W and S/W
- Early attempts for implementation
 - ▣ Based on a single, complex, unstructured program with many interacting components
 - ▣ Resultant software - very difficult to test and modify
- The International organization of Standardization (ISO) has developed a layered approach to overcome such problem
- In a layered approach
 - ▣ Networking concept is divided into several layers, and each layer is assigned a particular task
 - ▣ Networking tasks depend upon the layers

- Example:
Communication

mail

□ Layered Architecture

- Aim - to divide the design into small pieces
- Each lower layer adds its services to the higher layer to provide a full set of services to manage communications and run the applications
- Provides modularity and clear interfaces
 - i.e. provides interaction between subsystems
- Ensures the independence between layers
 - by providing the services from lower to higher layer without defining how the services are implemented
- Any modification in a layer will not affect other layers

Cont...

- An example of the five-layered architecture

Cont...

- Basic elements of layered architecture
 - ▣ **Service:** Set of actions/assistances that a layer provides to the higher layer
 - ▣ **Protocol:** Defines a set of rules that a layer uses to exchange the information with peer entity
 - ▣ **Interface:** Way through which the message is transferred from one layer to another layer

Cont...

- Need for Layered architecture
 - ▣ Divide-and-conquer approach
 - Makes a design process in such a way that the unmanageable tasks are divided into small and manageable tasks
 - ▣ Modularity
 - Provides the independence of layers, which is easier to understand and implement
 - ▣ Easy to modify
 - Implementation in one layer can be changed without affecting other layers
 - ▣ Easy to test
 - Each layer can be analyzed and tested individually

Open System Interconnection Model

- The International Standards Organization (ISO) introduced Open System Interconnection (OSI) Model in the late 1970s
- ISO OSI model
 - ▣ A Reference Model - describes how information from a software application in one computer moves through a physical medium to the software application in another computer
 - ▣ Consists of seven layers, and each layer performs particular network functions
 - ▣ Each layer is self-contained, so that tasks assigned to each layer can be performed independently
